#### **NAME**

ovs-tcpdump - Dump traffic from an Open vSwitch port using **tcpdump**.

## **SYNOPSIS**

ovs-tcpdump -i port tcpdump options...

# **DESCRIPTION**

**ovs–tcpdump** creates switch mirror ports in the **ovs–vswitchd** daemon and executes **tcpdump** to listen against those ports. When the **tcpdump** instance exits, it then cleans up the mirror port it created.

**ovs**—**tcpdump** will not allow multiple mirrors for the same port. It has some logic to parse the current configuration and prevent duplicate mirrors.

The -i option may not appear multiple times.

It is important to note that under **Linux** based kernels, tap devices do not receive packets unless the specific tuntap device has been opened by an application. This requires **CAP\_NET\_ADMIN** privileges, so the **ovs-tcpdump** command must be run as a user with such permissions (this is usually a super-user).

## **OPTIONS**

-h

**--help** Prints a brief help message to the console.

 $-\mathbf{V}$ 

## --version

Prints version information to the console.

### --db-sock

The Open vSwitch database socket connection string. The default is unix://var/run/open-vswitch/db.sock

## --dump-cmd

The command to run instead of **tcpdump**.

−i

## --interface

The interface for which a mirror port should be created, and packets should be dumped.

#### --mirror-to

The name of the interface which should be the destination of the mirrored packets. The default is miINTERFACE
